

Ideation Phase

Problem. Students raise IT support tickets for a school helpdesk. Choosing the right Category and Subcategory by hand is slow, inconsistent and error-prone, and IT staff spend manual effort sorting tickets.

Idea. Students enter only the Caller Name and a Short Description. Once the ticket is submitted, a Flow Designer automation reads the description, looks for keywords and fills in the Category and Subcategory automatically. The caller then receives a confirmation email.

Key benefits

- Consistent classification of every ticket
- Eliminates human error in categorization
- Reduces manual effort for IT staff
- Fully no-code, easy to maintain and scalable
- Instant acknowledgement to the caller by email

Scope boundaries

The solution uses simple keyword matching, with no complex scripting or machine learning. It suits small to medium environments such as schools and colleges.
