

Project Documentation

Testing, Validation and Security

Data validation checks:

- Mandatory fields captured correctly
- Auto-number generated without duplication
- Category and Subcategory values stored accurately
- Reference fields resolve correctly to user and group tables

Test	Input (Short Description)	Expected result
Scenario 1	WiFi not working in library	Category: Network; Subcategory: Wi-Fi; email sent to caller
Scenario 2	Projector not turning on	Category: Hardware; Subcategory: Projector; email sent to caller

For each test: enter a Caller Name and the description, save the form, then reload it to see the auto-filled fields.

Checking the email

All menus, search **Emails**; under System Logs select Emails. Search by the subject, open the record and click **Preview mail** under Related Links.

Deployment: update set

- 1 All menus, search **Local Update Sets** and open the project update set.
- 2 Change State from **In progress** to **Complete** and save.
- 3 Under Related Links click **Export to XML**.
- 4 Share the downloaded XML file (for example by WhatsApp or email) so others can load the update set.

Conclusion

The project delivers an end-to-end, no-code automation that classifies IT tickets from the Short Description and acknowledges the caller by email. Dependent choice fields keep data accurate, and a phased approach kept the build stable and easy to maintain. It can be extended later with assignment automation, SLA tracking or predictive intelligence.
